INFORMATION TECHNOLOGY AND HOSPITAL ADMINISTRATION

Angkor Hospital for Children has more than 500 staff, based at both AHC in Siem Reap and at the satellite clinic 35km away. More than 150 of these staff are non-medical, working behind the scenes of the hospital to ensure everything runs smoothly. Without these essential teams, administering the work and staff of the hospital, chaos would certainly reign! We are urgently seeking funds to modernize our IT systems to preserve and protect information; and to introduce an electronic Human Resources system so that our 500+ staff can be managed more effectively. Please consider funding one of these items – all of which are key to the future of AHC's knowledge and information management.

New Server

Migration of server architecture to new, back-up Server package $90,000

New Server:
The integrity of AHC's IT systems and server architecture are vital in ensuring that all of our staff – both medical and non-medical – have access to the information they need. Currently we only have one server which makes our data storage very vulnerable – a power surge, fire or floor could result in the total decimation of all of AHC's historical and current data – we are now urgently seeking funds for a back-up server to ensure the secure and safe keeping of all of our digital information, including finance, HR and medical records.

Licensing of Software

Software Licensing $12,000

Licensing of Software:
In order to fulfil legal licensing obligations, AHC needs to ensure all of our operating systems and software have fully up-to-date Microsoft licenses. AHC is entitled to lower-priced NGO licensing, which means that licenses will cost a fraction of the regular commercial prices.

Safety Infrastructure

Human Resources Software Package $5,000

Human Resources software:
All human resources processes are currently undertaken without the assistance of a HR software package, resulting in a heavier workload for the small HR team. We know that our 500+ staff are our best asset, so AHC has identified the need for HR software to ensure that HR tasks are carried out with efficiency, reliability and in a timely manner.
